Outline

Supply Chain Security

SCA & Vulnix

Problem statement

A Submit unauthorized change

B Compromise source repo

C Build from modified source

D Compromise build process

E Use compromised dependency

F Upload modified package

G Compromise package repo

H Use compromised package

Hydra package signing

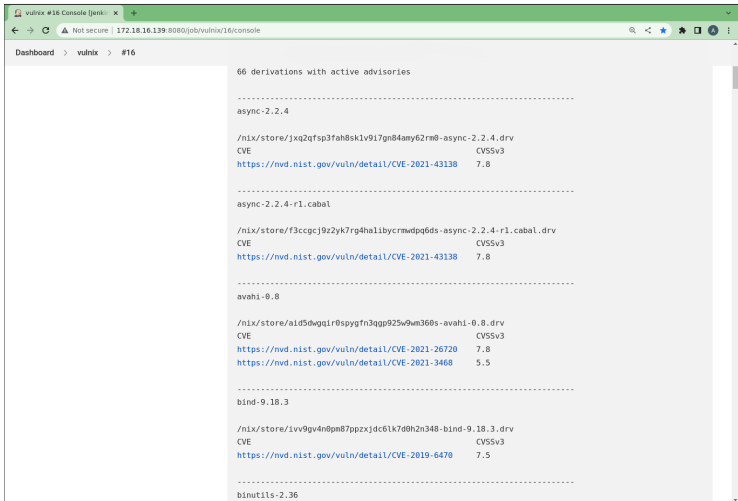

Binary cache package signing

Jenkins package signature verification

SCA (Software Composition Analysis)

- Automated process that defines the open source software in the codebase.
- Companies need to be aware of potential obligations, limitations and security vulnerabilities that open source brings into play.
- As the codebase grows, tracking all of those becomes rather tricky.
- SCA takes use of automatic scanners to enable productivity without compromise on security.

Look & Feel

The screenshot shows a web browser window with the address bar displaying "172.18.16.139:8080/job/vulnix/16/console". The page title is "vulnix #16 Console [jenkins]". The breadcrumb navigation shows "Dashboard > vulnix > #16". The main content area displays "66 derivations with active advisories" and lists several packages with their associated CVEs and CVSS scores.

[Vulnix] Theory of operation

- Pulls all known CVEs from NVD
- Matches a list of derivations against CVE entries
- Whitelisting is used to suppress unwanted results

[Vulnix] Pros & Cons

[Vulnix] Pros & Cons

Pros

- Fast
- Easy integration
- Written in Python - easy to maintain
